**Problem 1**

---

**Theorem:**

The set  $F$  of all functions from  $N$  to  $N$  is uncountable.

**Proof:**

The proof is by contradiction. Suppose that  $F$  is countable, then there exists a correspondence between  $N$  and  $F$ . Each member  $f$  in  $F$  can be represented by a string of natural numbers. For example,  $f = "10, 4, 8, 55, \dots"$  means that  $f(1) = 10$ ,  $f(2) = 4$ ,  $f(3) = 8$ ,  $f(4) = 55$ , and so on. The following table shows a few entries of a hypothetical correspondence  $g$  between  $N$  and  $F$ :

<b>n</b>	<b>g(n)</b>				
1	<b>10</b> ,	4,	8,	55,	...
2	2,	<b>7</b> ,	99,	40,	...
3	4,	7,	<b>20</b> ,	35,	...
4	32,	56,	126,	<b>24</b> ,	...
...	...				

However, a function  $f^*$  can be found in  $F$  that is not paired with any  $n$  in  $N$ . It can be constructed in a way that it is different from all the functions in the correspondence  $g$ . For example,

- $f^*(1) = 11$  that is greater than  $(g(1))(1)$  by 1
- $f^*(2) = 8$  that is greater than  $(g(2))(2)$  by 1
- $f^*(3) = 21$  that is greater than  $(g(3))(3)$  by 1
- $f^*(4) = 25$  that is greater than  $(g(4))(4)$  by 1

In other words,  $f^*(i)$  is greater than  $(g(i))(i)$  by 1 for all  $i$  in  $N$ . It is different from all the functions in the correspondence  $g$ . A contradiction results and there does not exist a correspondence between  $N$  and  $F$ . Hence, the set  $F$  of all functions from  $N$  to  $N$  is uncountable.
